

1 Frontpage

- A mobile learning tool to train health workers and medical students.
- So what is Clinical Practice Guidelines?

2 Introduction

CPGS formalizes research, and is validated for use in treatment.

Recommendations, as there are valid reasons for not always following the recommendation.

- Summary of the best and latest available evidence.
- We are weighing benefits and harm to each other.
- All patients gets the same treatment for the same condition.
- Since formalized, better use of resources, work more efficient as of standardizing, reduce outlays for hospitalisation, use cheaper medicine.

3 Introduction

- **Lack of self-efficacy:** they don't believe in themselves that they execute the instructions in the guideline with high quality.
- **Inertia of previous practice:** the custom, habit or previous training can hinder the adaptation of clinical practice.
- Lack of outcome expectancy.
- We can address these issues with a training game.

4 Possible asthma in paediatrics - Norway

- Large Guidelines. 400 pages.
- This one is used for emergency clinics in Norway.
- Wall of text

- Symptoms left, treatment right.
- Not good at point of care. We can improve.

5 Research questions

- **RQ1:** Generic data structure used to implement guideline training games. Application adaptable to the level of their users.
- **RQ2:** Specific data structure for paediatric asthma.
- **RQ3:** Using the specific data structure in a guideline training game, that can adapt to the level and progression of their users.
- **RQ4:** Is the metamodel at an abstraction level such that it can be used to represent other guidelines such as paediatric pneumonia?

6 Approach

7 Gamification of Clinical Practice Guidelines

- **Multiple-try with feedback:** Multiple attempts to get a question right and the feedback is right or wrong.
- **Problem with multiple-try with feedback:** bad or unmotivated students will click randomly.
- **Solution:** a button where you can continue without selecting the correct answer.
- **Penalty and reward:** small penalty and large reward motivates to revise an incorrect answer.

8 Architecture

- **Question flow manager:** adapts the questions to the level of the student. It is flexible such that

the student can choose his own way through the learning material. It controls the flow of the questions.

- **Conversation manager:** produces questions and answer keys from a template, in which the entity model is used to fill in data for the place holders in the template.
- **User manager:** keeps track of the user's skill, based on the performance on previous quizzes. It holds the scores for the current quiz, and it measures the user's progression.

9 Possible asthma in paediatrics - Kenya

- Assessment, get an idea of what diagnosis a patient may have.
- Diagnosis, strengthen your assumption and pick a severity.

- Management, treatment and procedure.
- Evaluation and act on the evaluation.
- What the patient should do on his own and follow-up.

10 Workflow graph

- It's the flow of the clinical encounter.
- Based on the guideline.

11 Excerpt of the entity graph

- This is a skeleton, an excerpt to keep the complexity down and keep it more compact.
- It represents the patient at a given time in the clinical encounter.

- You give the patient medication, and hopefully the symptoms in the graph has changed when you evaluate.

12 Making scenarios, answer keys, distractions

Conversation manager

- Detail level of the entity graph (patient).
- We are using templates to create narratives.
- Tags refer to vertices in the graph. Both in template and answer key.
- Can use the same template with other graphs to make new narratives with matching answer key.
- Can also reuse the graph on other templates.

13 Making scenarios, answer keys, distractions

Problem: The values can't be directly printed in the narrative. What is 24? What is True? V?

14 Making scenarios

- Attach a presentation vertex to all values.
- If a vertex doesn't have a presentation, simply return the value.

15 Entity- and workflow model working together

Patient has mild or moderate asthma. Treat with oxygen and salbutamol.

16 Entity- and workflow model working together

Patient shows no symptoms of asthma. Send patient home on salbutamol.

17 Dynamic Content Management

Question flow manager

- A way to control the content flow in the application.
- Instead of every student going through the same learning material in the same way, we try to adapt it to the individual learner.

18 Dynamic Content Management

- We split the content in relation to the clinical encounter (workflow model).

19 Dynamic Content Management

We have identified

- the knowledge units.
- the dependency between the knowledge units.
- expressed the dependency as a prerequisite.

Need to learn how to diagnose and treat a patient, before you can evaluate the treatment and act.

20 Dynamic Content Management

- The student can finish assessment, diagnosis or management in any order he wants.
- Have to complete all categories at one level to be able to progress to the next level.
- The detail level of the questions increases for each level.
- Demonstrate learning map and student map.

21 Demonstration

- Pick a quiz.
- The difficulties shows where the student is in the learning map.

22 Demonstration

- Scenario.
- Assessment.
- Multiple choice.
- Feedback.
- Shows an explanation when correct.
- Wheeze.

23 Demonstration

- The scenario continues.
- Diagnosis.
- Oxygen saturation $\geq 90\%$

24 Demonstration

- Management.
- Prednisolone and oxygen.

25 Demonstration

- Follow-up. Asks about prednisolone.
- Can try again. Gets penalty for every wrong attempt.
- Can choose to give up, see the answer and continue, but loses the reward.
- We want the user to encourage the user to revise the question.
- 5 days.

26 Demonstration

- We did very well and our position in the learning map is updated.
- We still have to redo follow-up before we can continue to level 3.
- The graph shows the score in each individual category as bars. The line is the passing condition in each category.
- We didn't pass follow-up.
